EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Thomas Luebbering on August 31, 2009.

2. The application has been amended as follows:

In the Claims

Claims 50 and 51 have been rewritten as follows:

-- 50. (Currently Amended) A method of processing segments of a continuous flexible web wherein a length of the web is incrementally advanced under tension to successively feed at least one segment of the web to a web processing station having processing components for cutting the flexible web, said method comprising:

intermittently releasing tension on the length of the web while said at least one segment thereof is at the processing station;

holding each said successive segment of the length of the web using a holder while the segment is positioned at the web processing station;

using the holder to continue to hold the held segment of web at the processing station while allowing the held segment to move relative to adjacent portions of the web

due to said released tension on the length of the web, the holder holding said held segment being moveable in an X axis direction of feed of the length of the web to the processing station, in a Y axis direction transverse of the X axis direction, and about a Θ axis of rotation of the holder perpendicular to said X and Y axis directions;

accurately adjusting the position of the held segment of the web at said processing station prior to processing thereof by subjecting the holder holding said held segment to controlled adjustment motion selected from the group consisting of motion along said X axis, motion along said Y axis, motion in the form of rotation about said Θ axis, and simultaneous combinations of said motions as required to obtain accurate alignment of the held segment of the web with the processing components at said processing station; and

processing each held segment by cutting each held segment using said processing components within the station after said accurate adjustment thereof.

51. (Currently Amended) The method of claim 50, wherein the processing components include die cutting elements, and wherein said cutting processing step includes subjecting the held segment of the web at said processing station to die cutting after said accurate adjustment of the position of the held segment of the web such that said held segment is aligned with the die cutting elements prior to die cutting--.

Claim 54 has been rewritten as follows:

- 54. (Currently Amended) The method of claim 50, wherein said step of intermittently releasing tension of the length of the web comprises ~~further comprising:~~
feeding the length of the web in said X direction while maintaining said tension on said length; and
relaxing the tension on said length while said held segment of the web is held at said processing station and during said accurate adjustment of the position of the held segment of the web at said processing station.--.

In the Abstract

3. The replacement abstract has been rewritten and has provided on a separate sheet included herewith as required.

Remarks

4. The above changes to the claims have been made to further clarify the claimed invention.

Additional Prior Art

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. These references disclose features similar to the claimed invention.

Abstract

Web processing method and apparatus (30, 300) is provided for high speed, extremely accurate die cutting or lamination operations. Processing station (32,300) includes a vacuum hold down plate (32,308) which receives and holds an image bearing incremental segment of the web. In feed and out feed tension on the web is released while a segment of the web is held by the hold down plate. The hold down plate with a segment of the web thereon is selectively shifted about X, Y, and Θ axes as required to bring the image on the web segment into alignment with a web processing component at the processing station.

Reasons for Allowance

6. The following is an examiner's statement of reasons for allowance:

None of the prior art of record, either taken alone or in combination, teaches and/or fairly suggests the claimed invention. For example, while Maruyama et al., pn 5,528,488, discloses a similar positioning system, it does not teach or suggest the step of intermittently releasing tension on the length of the web as claimed, and further, does not teach or suggest the step of processing each held segment by cutting each held segment using said processing components within the station after said accurate adjustment thereof.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Clark F. Dexter whose telephone number is (571)272-4505. The examiner can normally be reached on Mondays, Tuesdays, Thursdays and Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Boyer D. Ashley can be reached on (571)272-4502. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
